

Idle Free Olds

DID YOU KNOW:

- Idling contributes to air pollution, greenhouse gas emissions, increases engine wear and increases fuel consumption.
- Vehicles warm up fastest while driven. Most modern vehicles only need to idle for a few seconds prior to driving.
- Using a block heater for two hours prior to driving will warm up the engine and has been known to help improve fuel economy. Use an automatic timer to switch on the block heater for increased efficiency.
- To reduce idling you can also turn off your vehicle when waiting, talking with friends and running quick errands.
